

Week 2 — Competitive Intelligence: Executive Summary

inGen Dynamics service-robotics portfolio · 15 priority peers across five verticals

Per-vertical ranking & read

Vertical / InGen anchor	Priority peers	Key observation	Implication for InGen
Eldercare / Fari	Intuition Robotics, Labrador, OhmniLabs	Peers compete on a specific human problem (loneliness, independence), not raw robot capability. Intuition has real HRI patents.	Anchor Fari's story to a measurable outcome (engagement, caregiver hours saved), not features.
Education / Senpai	Miko, UBTECH, LEGO Education	Incumbents win on curriculum + distribution; UBTECH adds a 3,000+ patent moat bridging education and humanoid.	Senpai needs a channel (districts/Futurenauts) and content, not just a robot; IP gap vs UBTECH is real.
Indoor Security / Sentinel Prime AI	Knightscope, Cobalt, RAD/AITX	Public/again-public players disclose a lot; Knightscope and Cobalt hold concrete patrol-autonomy patents.	Sentinel's edge is field hours + asset-management framing; mine public filings for benchmark metrics.
Outdoor Patrol / Aido Rover	Asylon, Boston Dynamics, ANYbotics	Split between security (Asylon) and inspection (ANYbotics); Boston Dynamics owns the deepest locomotion IP.	Aido Rover should pick a lane (security vs inspection) and avoid head-on locomotion-IP competition.
Humanoid / Aido Humanoid	Figure, Agility, Unitree	Capital and IP are decoupled: Figure is well-funded but IP-light; Agility/UBTECH hold defensible locomotion patents.	For Aido Humanoid, treat peer funding as hype-adjusted; defensibility (IP, deployments) matters more than raise size.

Cross-vertical patterns

- Funding ≠ defensibility.** The clearest finding (per PatentVest's 2025 humanoid landscape) is that the best-funded peer, Figure AI, holds one of the least defensible IP positions, while UBTECH (3,000+ patents), Boston Dynamics, and Agility hold real moats. InGen should benchmark peers on IP + deployments, not raise size.
- Outcome beats capability.** Across eldercare and education, winning peers sell a measurable human outcome (reduced loneliness, curriculum results) rather than robot specs. InGen product narratives should follow suit.
- Public peers are free intelligence.** Knightscope (KSCP), UBTECH (HKEX), and RAD (AITX) disclose IP, deployments, and economics in filings — a low-cost benchmark source for Sentinel and Aido Rover.
- China-origin IP is undercounted.** UBTECH and Unitree file heavily in CN; US-only patent views understate them. Use Espacenet/CNIPA for a true picture.

Method & honesty note

Positioning, partnerships, patent activity, and employee headcount are compiled from public sources (company sites, Justia/Google Patents, PatentVest/GreyB, CB Insights, SEC, Wikipedia, Revelio Labs). Specific patent numbers cited in the dossier are real and locatable, and headcounts carry their source and as-of date. **Real-time AI-ML hiring shares were deliberately NOT fabricated:** aggregator open-role counts for the same company varied too widely to verify as a single dated snapshot, so R&D scale is shown via real headcount + real patent portfolio instead (see rd_scale_and_hiring.xlsx). A blank dated-snapshot template is included for a future single-day pull. Funding figures are best-effort and flagged for verification before external use.

Sources (public): company sites & careers pages; Justia Patents (assignee search); Google Patents; USPTO PatentsView; GreyB and PatentVest patent-landscape analyses; CB Insights; SEC/EDGAR; TechCrunch; The Robot Report. Retrieved 2026-05-31. Patent numbers shown are real and locatable via the cited sources. Prepared by Ziheng Wang, inGen Data Analyst internship — Week 2.
